Acupuncture as a treatment for immune-system disease

Acupuncture has been shown to be beneficial for patients suffering from a plethora of different immune-suppressing diseases. Diseases such as Immune-System Dysregulation Syndrome have been affected positively by acupuncture treatments.

According to a study published by Medical Acupuncture, patients facing chronic immunosuppressant conditions have been helped by acupuncture treatments. This study specifically targeted a patient with a vast range of conditions including Crohn's disease. The patient was 41 years old and treated with acupuncture to relieve the kidney, lung and spleen.

The study noted the deficiencies within the patient's kidney, lung and spleen needed to be relieved. Acupuncture treatment was administered to the patient once a week.

Due to the acupuncture treatments received by the patient there was a lot of improvement noticed in their overall health and wellbeing. The patient reportedly had increased energy levels, less dependence on steroids and other drugs being used for pain, a decrease in the amount of overall pain they were feeling and his ability to exercise for extended periods of time was greatly improved.

This study further cements the fact that acupuncture can help with all kinds of diseases, injuries and problems you may be facing in your daily life.
